## Data Appendix

Figure A1 - Kernel density plot of the share of boundaries that abut a natural feature

Figure A2 - Yearly trend in segregation indices

Figure A3 - Distribution of the change in school racial composition after busing
Figure A4 - Impact of rezoning on number of arrests over time

Table A1 - Main results using 2001 address

Table A2 - Main results using $5^{\text {th }}$ grade address
Table A3 - Does re-zoning predict preexisting student characteristics?
Table A4 - Impact of re-zoning on short-run attrition from CMS

Table A5 - Sensitivity of test score results to other measures of school composition
Table A6 - Main results with share free lunch eligible

Table A7 - Main results with peer prior math scores

Table A8 - Trends in neighborhood school attendance
Table A9 - Separate results by test subject
Table A10 - Results with imputed test scores

Table A11 - Additional long-run outcomes
Table A12 - Analysis by grade cohort
Table A13 - Main results excluding students not enrolled in Fall 2002

Table A14 - Main results excluding students who moved, 2001-2002

Table A15 - Impact on enrollment/attrition over time
Table A16 - Main results, students with new school assignment only

Table A17 - Main results excluding previously bused students

Table A18 - Selected impacts on high school course-taking
Table A19 - Heterogeneity by race and income

Notes: This figure provides the portion of a unique boundary between two attendance zones (HS or middle) that is coterminous with a natural feature (major road, stream or railroad track) for boundaries that changed under resegregation relative to those boundaries that were unchanged. Results are weighted by the length of the boundary and we exclude boundaries that define Mecklenburg County. Unchanged boundaries - mean=.828, New boundary - mean= .730, Kolmogorov-Smirnov test for equality of distributions $-\mathrm{p}=0.017$.

Figure A2
Change in Measures of Segregation in CMS over time

Notes: This figure shows measures of the dissimilarity and exposure indices for CMS middle schools and high schools, from 1998 to 2007. The measures are calculated using CMS administrative data. We divide students into two racial groups - "minorities", which includes black and Latino students, and "non-minorities", which includes white, Asian and all other ethnicities.

Figure A3
Distribution of the Change in School Racial Composition After Busing

Notes: This figure plots the student-level change in the racial composition of the assigned school before and after the rezoning, separately by race. The mean values for Percent Minority are -0.07 for non-minorities and +0.08 for minorities, with standard deviations of 0.15 and 0.21 respectively.

Impact of Rezoning on Number of Arrests Over Time
Minority Males, All Grade Cohorts

Notes: Each point is the key coefficient and associated 95 percent confidence interval from a regression like equation (1) on the full sample of age-eligible students, estimated separately for four-month intervals. The coefficients are interpreted as the impact of a 100 percentage point increase in the share minority of a student's assigned school on the number of arrests for minority males in the indicated time period.

Notes: Within panels, each column shows coefficients and standard errors from a separate estimate of equation (1), and is interpreted as the impact of being assigned to a school with 100 percentage points more minority students, where the impact is allowed to vary by the race and gender combinations indicated in each row. Panel A presents results for rising 9th through 12th graders in the Fall of 2002, while Panel B presents results for rising 6th through 8th graders. All regressions control for race by cohort fixed effects, parcel group by prior middle and high school zone fixed effects, and quadratics in 5 th grade math and reading scores plus dummies for missing scores. College attendance records are obtained from the NSC data, which can track students who leave CMS schools. Criminal records are obtained from the Mecklenburg County Sheriff, and can track students who leave CMS schools. We define "minority" as black and Latino students, and "nonminority" as all other ethnicities (including whites). Standard errors are clustered at the prior zone and new zone by parcel group levels, using the multiway clustering procedure of Cameron, Gelbach and Miller (2011). *** p<0.01, ** $p<0.05,{ }^{*} p<0.10$

Notes: This table gives the share of students in each grade cohort that attended their assigned "neighborhood" school in each year. Years are based on Fall, so Column 1 shows the share attending their home school in the last year prior to busing. Assignment to cohorts is based on the first year a student appeared in 6th grade in CMS.

| Observations | 23,387 | 21,378 | 21,613 | 21,525 |
| Notes: In Panel A, each cell shows the coefficient and standard error from a separate estimate of equation (1), and is interpreted as the impact of being assigned to a school with 100 percentage points more minority students. Panel B presents results where the impact is allowed to vary by student's own race. Each column shows the results of a separate regression where the dependent variable is indicated in the column heading above; all regressions also control for race by cohort fixed effects, parcel group by prior middle and high school zone fixed effects, and quadratics in 5th grade math and reading scores plus dummies for missing scores. We define "minority" as black and Latino students, and "non-minority" as all other ethnicities (including whites). Standard errors are clustered at the prior zone and new zone by parcel group levels, using the multiway clustering procedure of Cameron, Gelbach and Miller (2011). ${ }^{* * *} \mathrm{p}<0.01,{ }^{* *} \mathrm{p}<0.05,{ }^{*} \mathrm{p}<0.10$ |  |  |  |  |

Notes: All regressions include fixed effects for racial group, cohort, parcel group, middle by high school zones prior to re-zoning, quadratic controls for 5 th grade math and reading scores, and indicator variables for missing 5 th grade scores. Columns labeled "Actual Score" display results from Table 3; Columns labeled "Predicted" are based on samples where we impute scores for students with missing test scores using a bivariate regression of high school test scores on 5th grade test scores in the same subject (i.e., English or math). We use either the predicted score itself, or the predicted score plus or minus 0.5 standard deviations. ${ }^{* * *} \mathrm{p}<0.01,{ }^{* *} \mathrm{p}<0.05,{ }^{*} \mathrm{p}<0.10$

Notes: Within panels, each column shows coefficients and standard errors from a separate estimate of equation (1), is interpreted as the impact of being assigned to a school with 100 percentage points more minority students, where the impact is allowed to vary by the race and gender combinations indicated in each row. Panel A presents results for rising 9th through 12th graders in the Fall of 2002, while Panel B presents results for rising 6th through 8th graders. All regressions control for race by cohort fixed effects, parcel group by prior middle and high school zone fixed effects, and quadratics in 5 th grade math and reading scores plus dummies for missing scores. Criminal records are obtained from the Mecklenburg County Sheriff, and can track students who leave CMS schools. College attendance records are obtained from the NSC data, which can track students who leave CMS schools. We define "minority" as black and Latino students, and "non-minority" as all other ethnicities (including whites). Standard errors are clustered at the prior zone and new zone by parcel group levels, using the multiway clustering procedure of Cameron, Gelbach and Miller (2011). *** p<0.01, ** p<0.05, * p<0.10

| Sample Size | 14,570 | 21,620 | 27,995 | 34,007 | 39,365 | 43,949 |

Notes: Each column shows coefficients and standard errors from a separate estimate of equation (1), and is interpreted as the impact of being assigned to a school with 100 percentage points more minority students, where the impact is allowed to vary by the race and gender combinations indicated in each row. The outcome is an indicator variable for being enrolled in any CMS school in the "expected grade" in each column. "Expected grade" is calculated as being enrolled in any CMS school in the year that a student should have been in each grade, based on the first time that student entered 6th grade. Sample sizes increase across columns because more cohorts were enrolled in the higher grades post-rezoning. All regressions control for race by cohort fixed effects, parcel group by prior middle and high school zone fixed effects, and quadratics in 5th grade math and reading scores plus dummies for missing scores. Standard errors are clustered at the Prior Zone by Parcel Group level. ${ }^{* * *} \mathrm{p}<0.01,{ }^{* *} \mathrm{p}<0.05,^{*} \mathrm{p}<0.10$
